

“Companies who deploy a MPS program reduce their costs by an average of 30% by actively managing print¹”

Toshiba Print Manager Suite is a modular and flexible offering which is tailored to ensure that you receive the best solution for your needs. Our Print Manager Suite will enable you to detect and uncover inefficiencies and change staff behaviour through enhanced monitoring and controlling of your print, scan and copy processes. Deploy just the functionality of our modular Suite to achieve the outcome that your organisation requires.

Control Costs

Toshiba Print Manager Suite can significantly improve your profitability by implementing simple controls for each user and device, giving your organisation visibility on their utilisation. For instance, controlling access to colour printing for internal documents in a workplace, or generating a report to see who produced the most colour usage in a month. Deploying tools to effect change on the users and modify habits will drive continual and lasting improvement.

Reporting

Toshiba Print Manager Suite offers a number of detailed reports that define the print usage volumes of your organisation. These can be for each device, department or individual, allowing you extensive control and tracking of your organisations print environment and total expenditures.

Control Access

Need your users to have more accountability for their print jobs? We offer solutions to integrate back to active directories that will track usage and also enable smart “Pull Print” technologies, often referred to as Find Me print. Pull printing can be integrated into your existing security card system or by utilising a pin code at the device to release print jobs or use for single sign on.

Policy for Print

To get ever lasting change in your organisation you need to control print as a category and have “print policies” in place to effectively manage the outcome. Print policies will allow you to control the way users print and how they print, a simple example is if a user prints a job which is not double-sided the policy will recommend the job be duplexed. For emails, if a user prints them in colour it can recommend that emails be produced in BW. This will greatly impact your bottom line and reduce your environmental impact (CSR).

Fleet Management

An organisation’s IT team should not spend any unnecessary time managing print devices. Our modular software suite can manage supplies, meter readings, deployment and configuration of drivers, user profiles and full diagnostic reporting on fleets varying in size and locations.

No longer will your IT team be burdened with maintaining a fleet of devices and the costs associated with them.
